

Working Group Report

WG C37.14

Standard for Low Voltage DC Power Circuit Breakers Used in Enclosures

September 26, 2001

Draft 4 of IEEE PC37.14 was successfully electronically balloted, closing June 25th. There were 19 affirmative votes, 5 negative votes, and 1 abstention. The ballot passed with 79% affirmative. The corrupted pdf file that was initially posted for balloting caused a major problem. This resulted in one of the negative votes.

A Draft 5 of IEEE PC37.14 has been generated which incorporates all the editorial comments, and also the attempts made for negative ballot resolution. The negative ballots have been addressed. Once three remaining resolution responses are obtained, there will be a 10 day recirculation ballot. This should happen in October.

There are issues that have resulted from work on this revision that are not resolved, and which should be subjects for the next revision WG.
