Main Issues:

- Dual logo. No negative votes from IEC but approval for a new work item did not go through IEC as too few countries offered specialists to work on the WG. This will be resubmitted and we believe that this time there will be sufficient support. However there is a possible problem due to this being a Technical Document rather than a Standard. IEEE are checking status.
- In order to eliminate as far as possible issues with referencing IEC and IEEE documents it was agreed to incorporate as much of the reference material as possible within the text of the document and where an external reference is necessary to only reference ISO documents.
- The document is now in IEC format and the WG will look at the document over the next few months with a target to have a revised document ready for ballot immediately after the Autumn meeting.
