## Annex M

(informative)

### Examples of encoding a frame for the MR-FSK PHY

This annex provides 14 examples of encoding a frame for the MR-FSK PHY as described in 16.1. In particular, generation of the PPDU bit sequence is described in detail. The first 6 examples use no coding, and the last 8 examples use convolutional coding. The examples are numbered from M.1 to M.14 and correspond to the scenarios in Table M.1. The frequency band used in these examples is the 915 MHz band, and these examples use Operating Mode #1 for the 2FSK examples.

In these examples, all binary sequences of length  $n$  are treated as bit strings:

$b_0 b_1 \dots b_{n-1}$

The corresponding entries are processed  $b_0$  first to  $b_{n-1}$  last.

In all these examples mode switch is not used, and the 4-octet FCS is used. In addition, the PIB attribute phyFSKPreambleLength is set to 4 so that 4 octets are used for all pREAMBLES.

**Table M.1 – Scenarios for MR-FSK**

Example Number	Modulation	Coding	Interleaving	Data Whitening	phyMRFSKSFD
M.1	2FSK	None	Off	Off	0
M.2	2FSK	None	Off	Off	1
M.3	2FSK	None	Off	On	1
M.4	4FSK	None	Off	Off	0
M.5	4FSK	None	Off	Off	1
M.6	4FSK	None	Off	On	0
M.7	2FSK	NRNSC	On	Off	0
M.8	2FSK	NRNSC	On	On	0
M.9	2FSK	RSC	Off	Off	0
M.10	2FSK	RSC	Off	On	0
M.11	2FSK	RSC	On	Off	0
M.12	2FSK	RSC	On	On	0
M.13	4FSK	NRNSC	On	Off	0
M.14	4FSK	NRNSC	On	On	0

In all examples the message encoded is a PSDU of 7 octets shown below. The message constitutes an acknowledgment frame with a 3-octet MHR and a 4-octet FCS, as defined in 5.2.1.9. The bit sequence of the example PSDU is: 0100 0000 0000 0000 0101 0110 0101 1101 0010 1001 1111 1010 0010 1000

The encoding illustration goes through the following stages:

- Generating the bit sequence of the SHR
- Generating the bit sequence of the PHR
- Generating the bit sequence of the PSDU
- Concatenating the PHR, PSDU, tail bits and pad bits
- Encoding the bit sequence of the PSDU with a rate  $\frac{1}{2}$  convolutional encoder (if necessary)
- Interleaving of the code-bit sequence (if necessary)
- Performing data whitening of the bits after the header (if necessary)

- h) Concatenation to form the PPDU
- i) mapping pairs of bits to symbols for 4FSK (if necessary)
