Re: []

Abstract: [A important use case of dependable body area network(WBAN) for implanted devices is introduced to perform reliable and massive data for ECoG-based Brain machine interface to require amendment for IEEE802.15.6 wireless medical body area network.]

Purpose: [information]

Notice: This document has been prepared to assist the IEEE P802.15. It is offered as a basis for discussion and is not binding on the contributing individual(s) or organization(s). The material in this document is subject to change in form and content after further study. The contributor(s) reserve(s) the right to add, amend or withdraw material contained herein.

Release: The contributor acknowledges and accepts that this contribution becomes the property of IEEE and may be made publicly available by P802.15.

Requirement for Wireless Medical BAN to Apply for ECoG-based Brain-Machine Interface

Takafumi Suzuki

Center for Information and Neural Networks, NICT**

Masayuki Hirata

MD, PhD & Meng, Professor

**Department of Neurological Diagnosis and Restoration,
Osaka University Graduate School of Medicine**

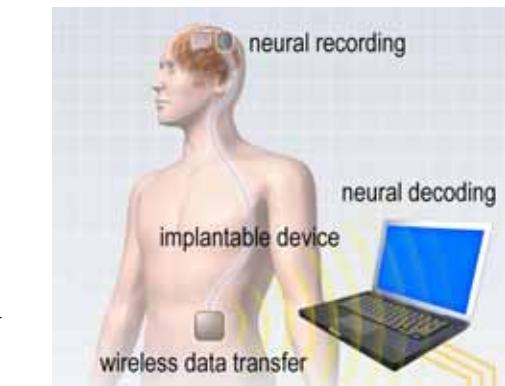

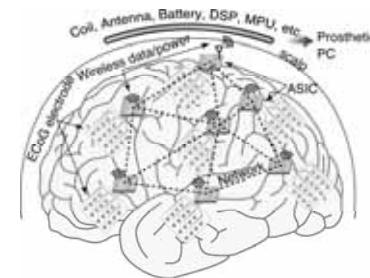

Outline

ECoG-BMI system

1st Generation **128ch system**: Clinical ECoG-BMI system
 → Clinical test in 2020

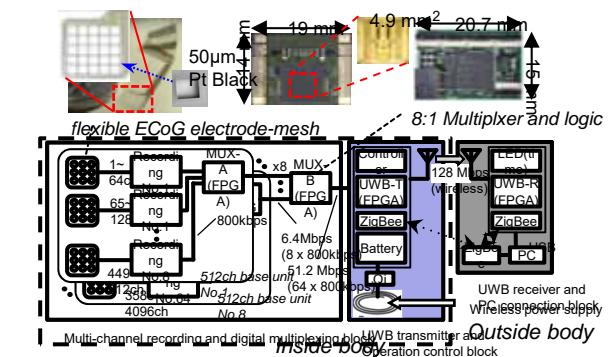

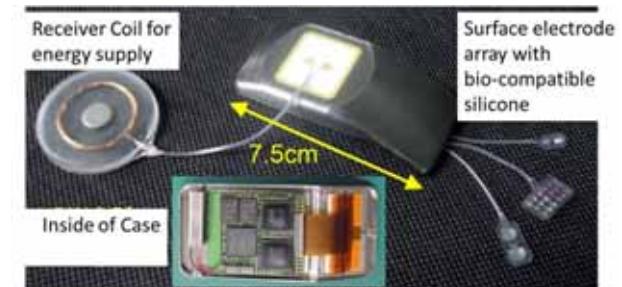

2nd Generation **4096ch system**

- Next generation system
- Flexible electrode technology
- UWB wireless technology

BMI (system evaluation)

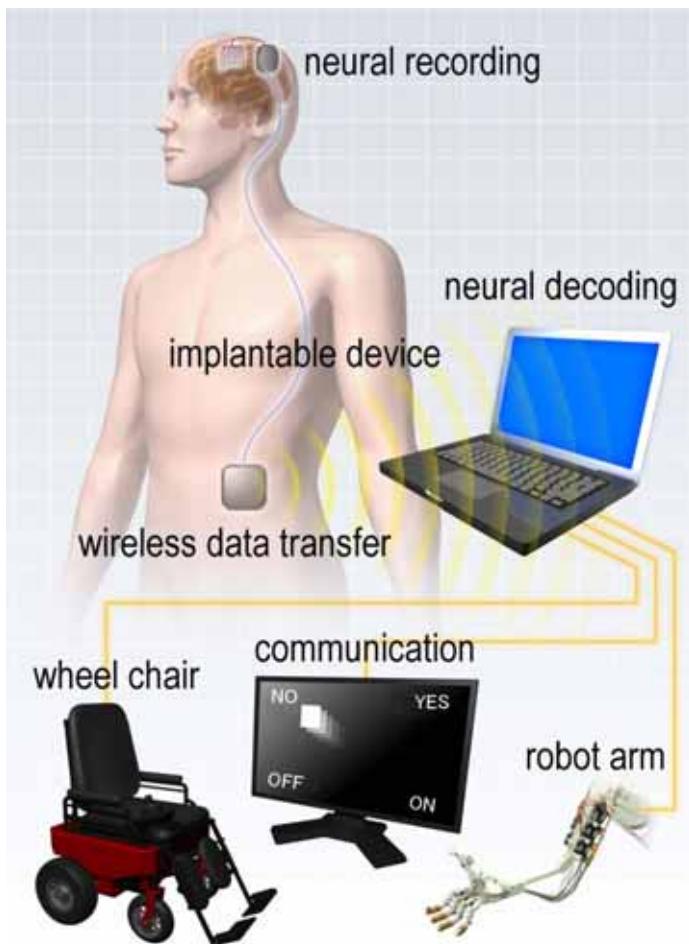

- Real-time decoding
- Robotic arm control and cortical adaptation

1st Generation (128ch ECoG-BMI system)

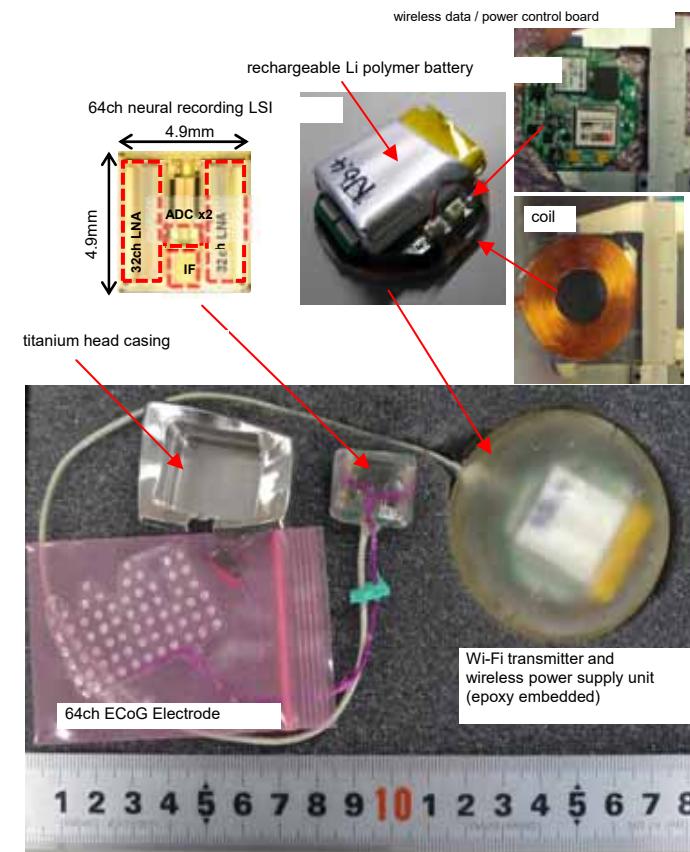

A fully implantable wireless BMI system

Pre-clinical test in 2017

Clinical test in 2018

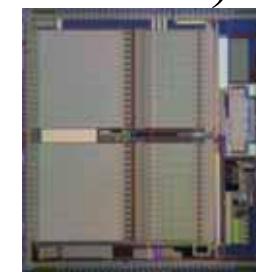

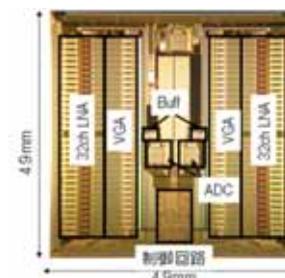

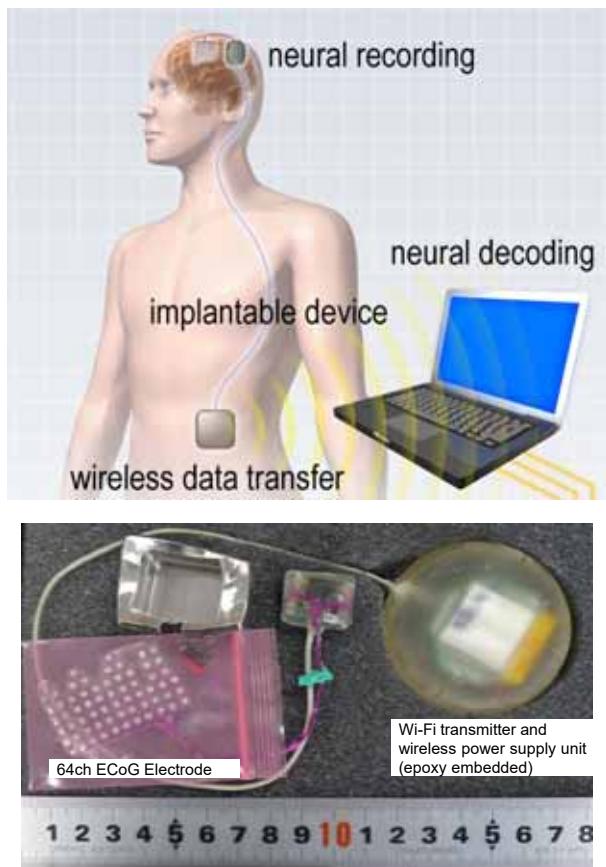

Prototype 64/128ch system
six months in a monkey (2013)

1st Generation 128ch system (Improvement for clinical use)

Abdomen unit

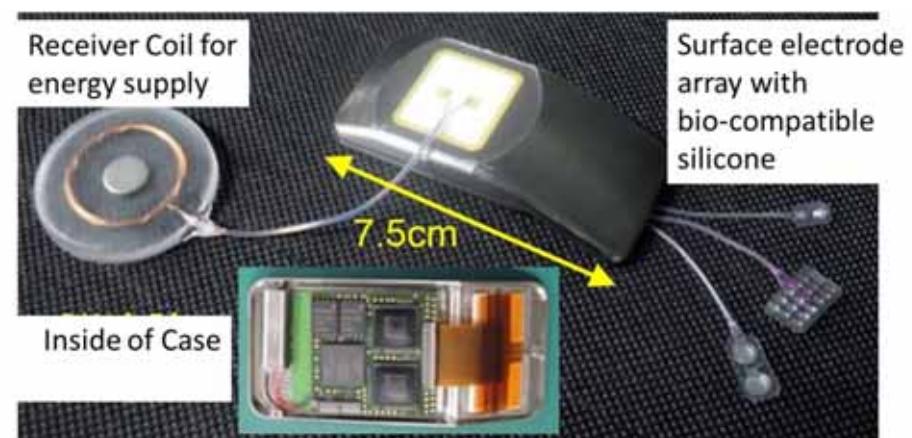

→ Integrated into head unit

Smaller system can decrease various risks.

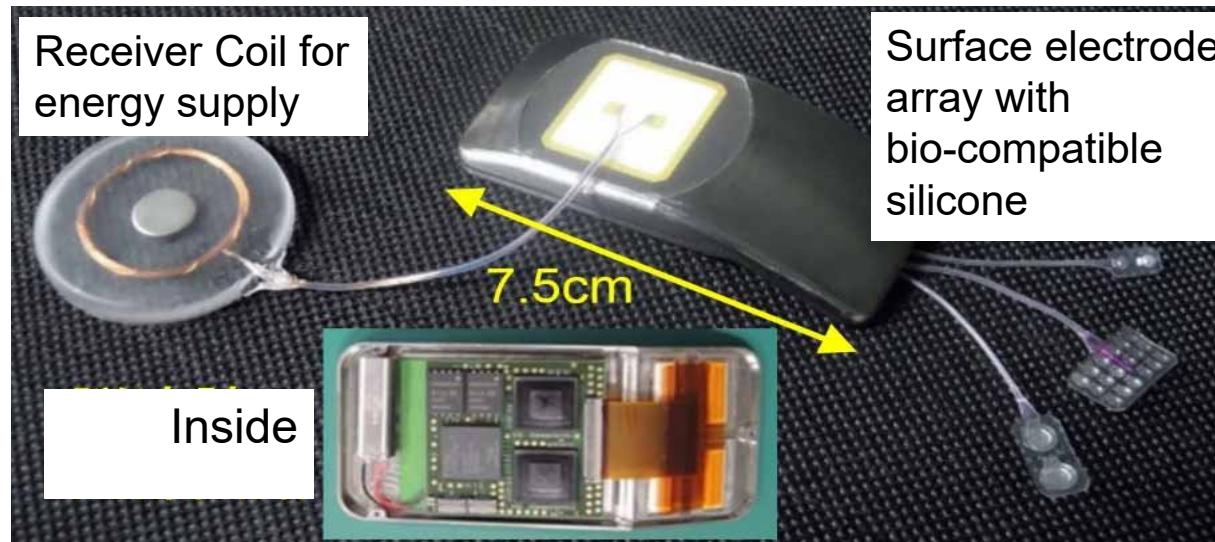

TSMC CMOS
0.25μm
(7.1mm × 7.3mm)

- LSI improvement
→ Lower noise, safety, etc.

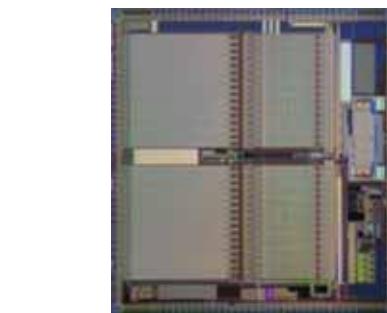

Current version:
Casing, non-touch energy supply

1st Generation 128ch system (Improvement for clinical use)

Wireless transmitter (2.4 GHz ISM Band) ~
1.9Mbps

TSMC CMOS 0.25 μ m
(7.1mm x 7.3mm)
-32ch x 4chips
-Noise (input) 3 μ Vpp
-Capable of High- γ
band recording
- GLP test (bio-compatiblilty)
- Implant test (animal)

2nd Generation (4096ch ECoG-BMI system)

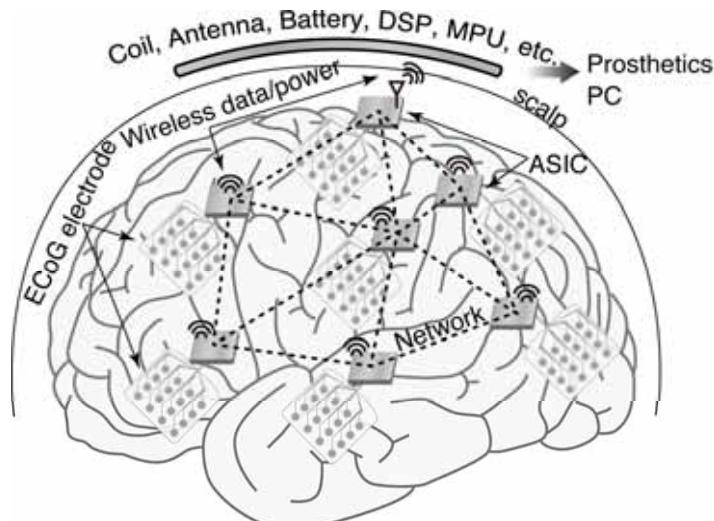

Next generation multi-channel BMI system more than 4,000 channels

For more accurate estimation of movement intentions

- a large number of recording channels
- recording at several regions simultaneously

Our target

implantable, distributed, and wireless

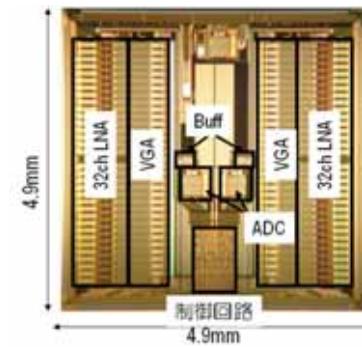

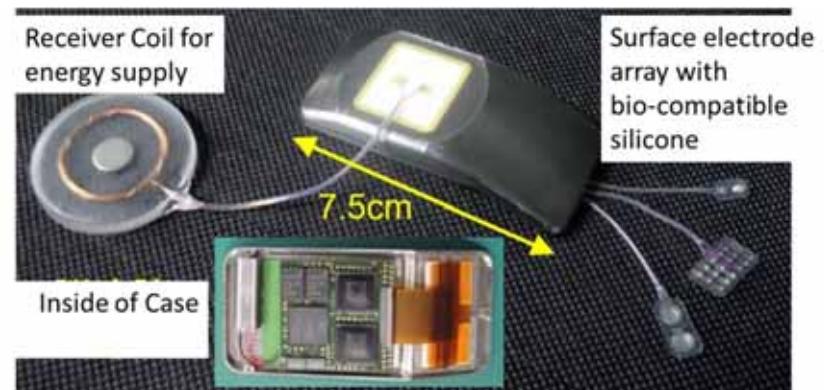

Issue of multi-channel system: volume of data
ex. ECoG, 1kS/s, 12bit-ADC

~1Mbps@100ch, ~100Mbps@10,000ch

Improvement for next generation (128ch-> 4096ch)

Issues to be solved

- (1): High density electrode array
Silicone + Pt array
→ **Parylene-C + Pt (or Au)**
- (2): LSI (amplifier + ADC)
32ch x 4 chips
→ 64ch x **64chips**
- (3): Wireless transmitting
ISM (1.9Mbps)
→ **UWB(128Mbps)**

2nd Generation (4096ch ECoG-BMI system)

Flexible electrode technology

Electrode Array (Safety, High density, Stability)

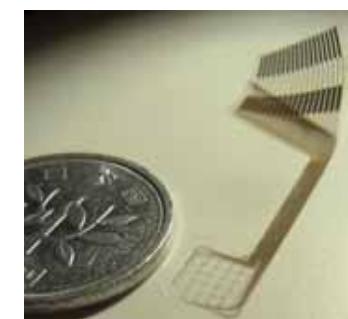

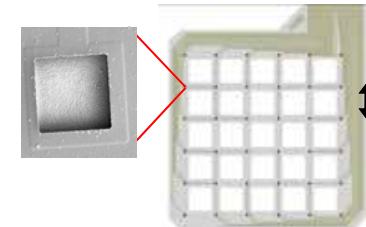

3D-shape
Individual MRI Data
1st Generation

3D-double surface
for intra-sulcus

(Hirata M, IEICE Trans Commun, 2011)

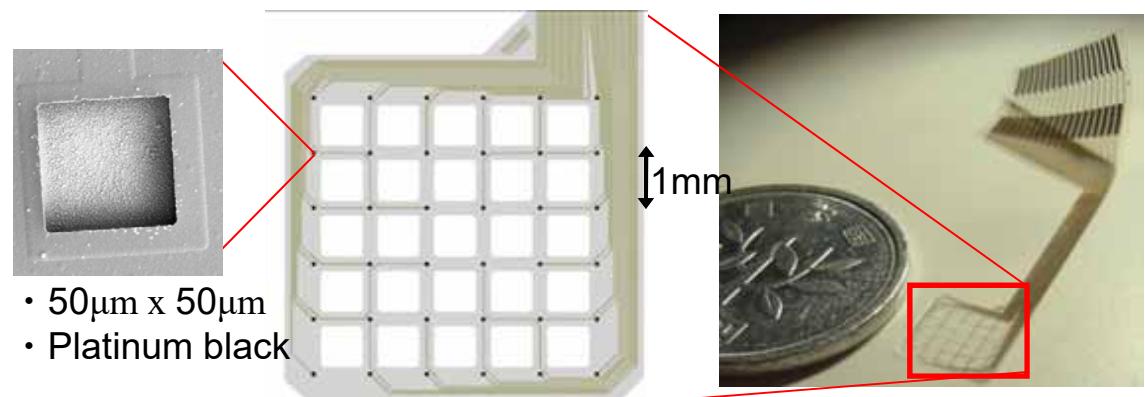

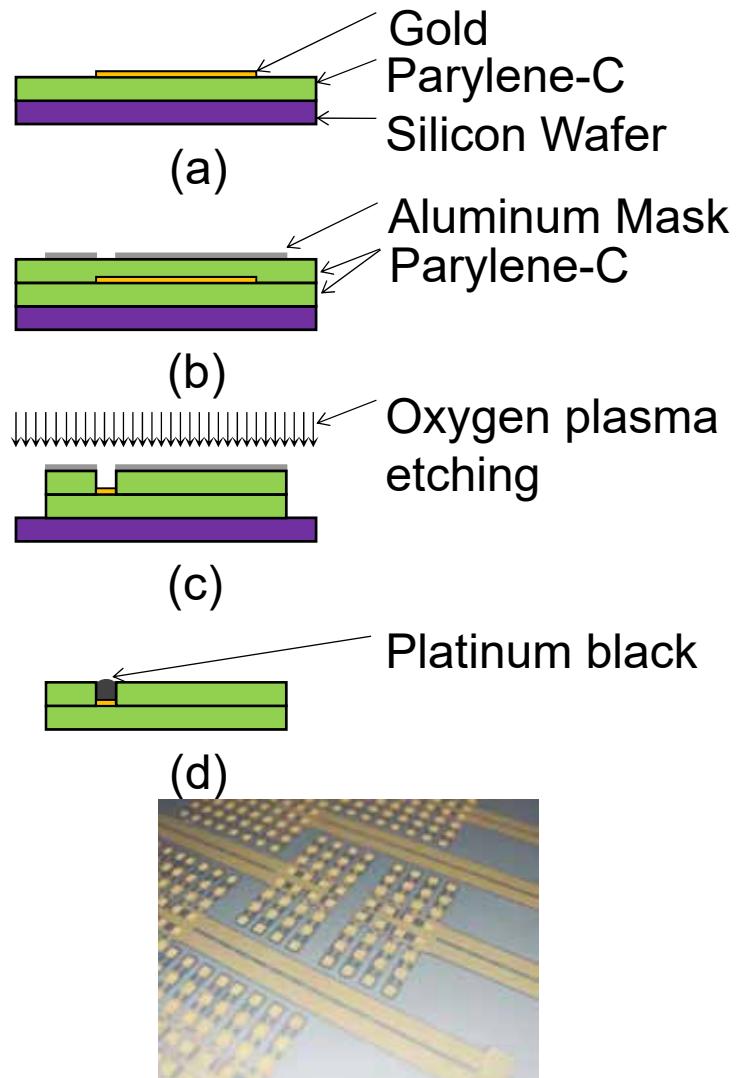

Flexible electrode array

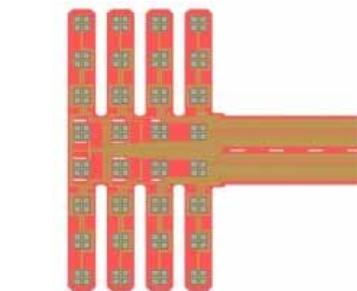

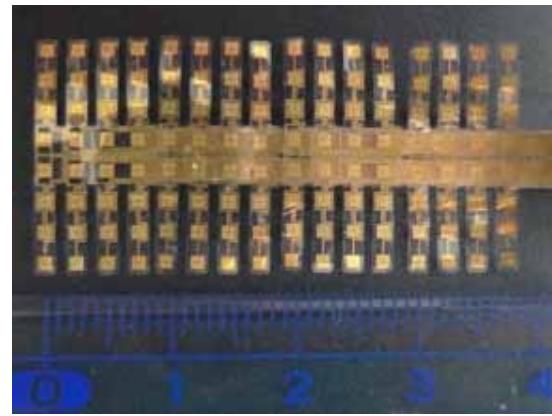

- Parylene-C, High Density: IED 50µm
- Relationship between intracortical and ECOG signal

2nd Generation

Flexible Electrode array for ECoG

Toda, Neuroimage(2011)

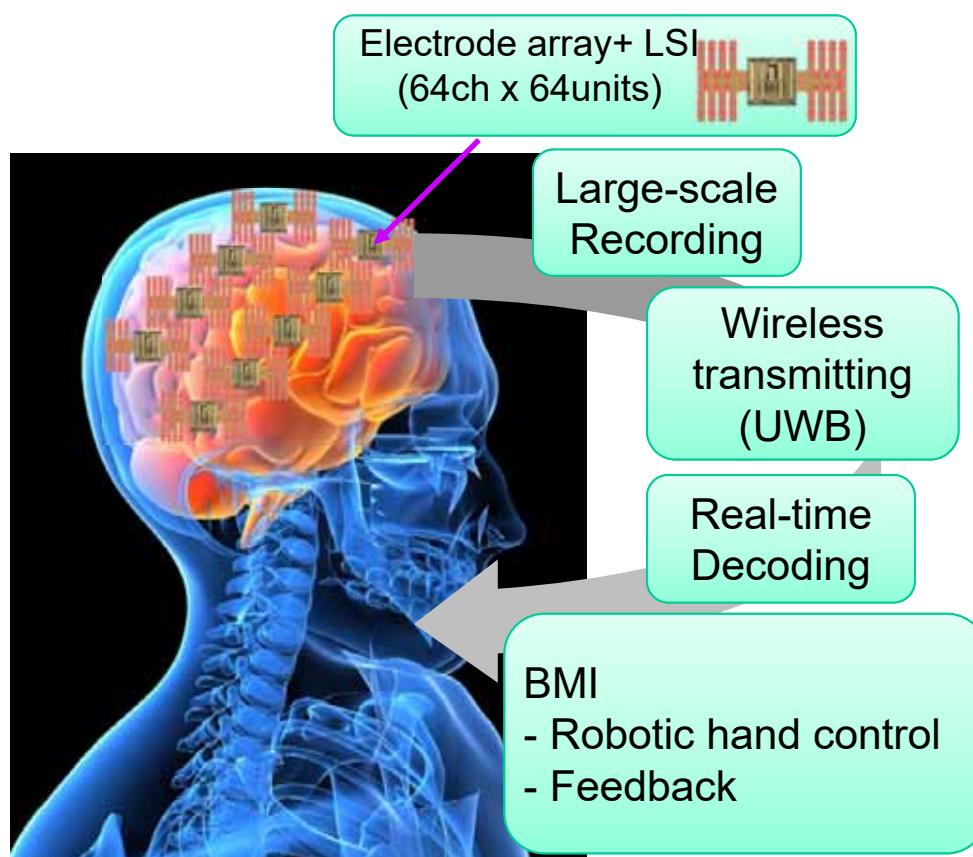

Monkey128ch
 - > 2.5 years
 - into sulcus
 (Hasegawa Lab,
 Niigata Univ.)

2nd Generation (4096ch ECoG-BMI system)

Wireless technology

UWB(Ultra-Wide
Band)

Super multi-channel system using UWB(4096ch ~)

1st Generation (128ch)

-ISM band (2.4GHz) [1.9Mbps]

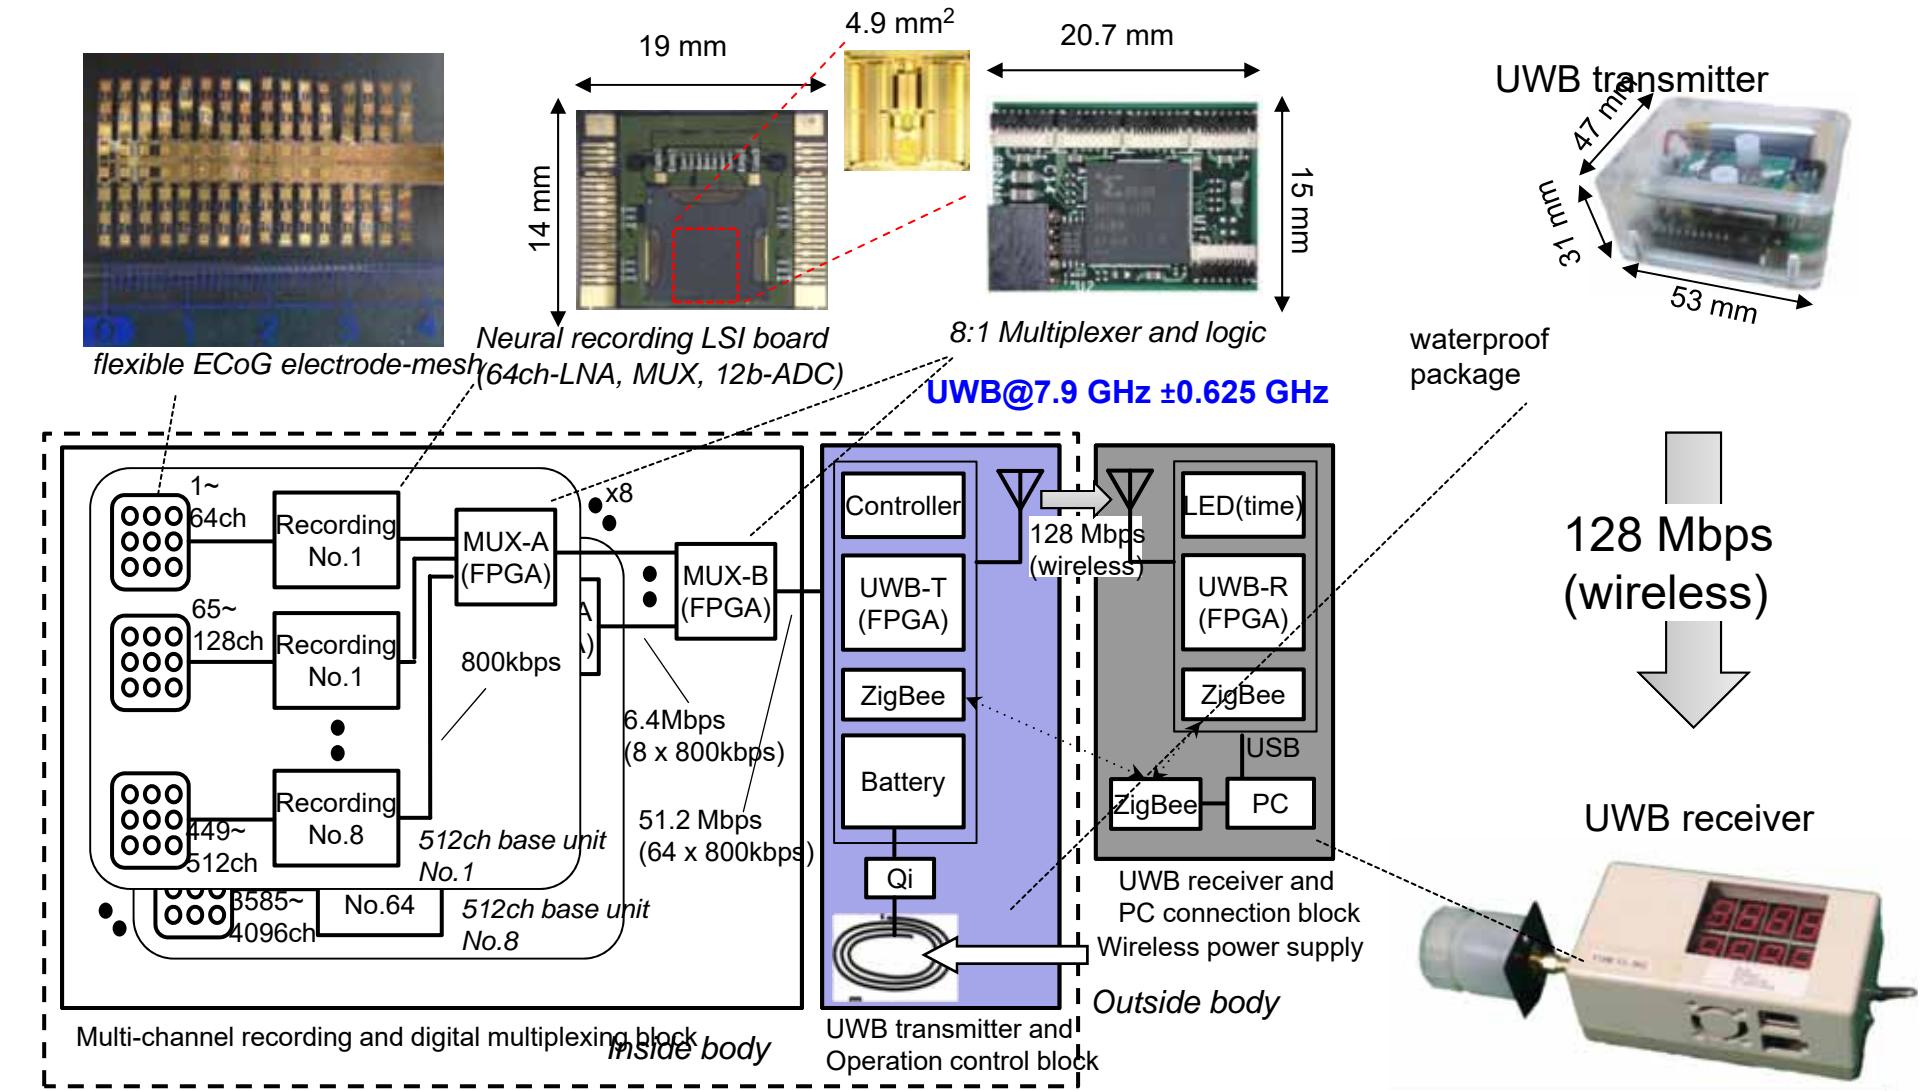

$$12\text{bit} \times 1\text{kHz} \times 128\text{ch} \\ = 1.5 \text{ Mbps}$$

2nd Generation (>4000ch)

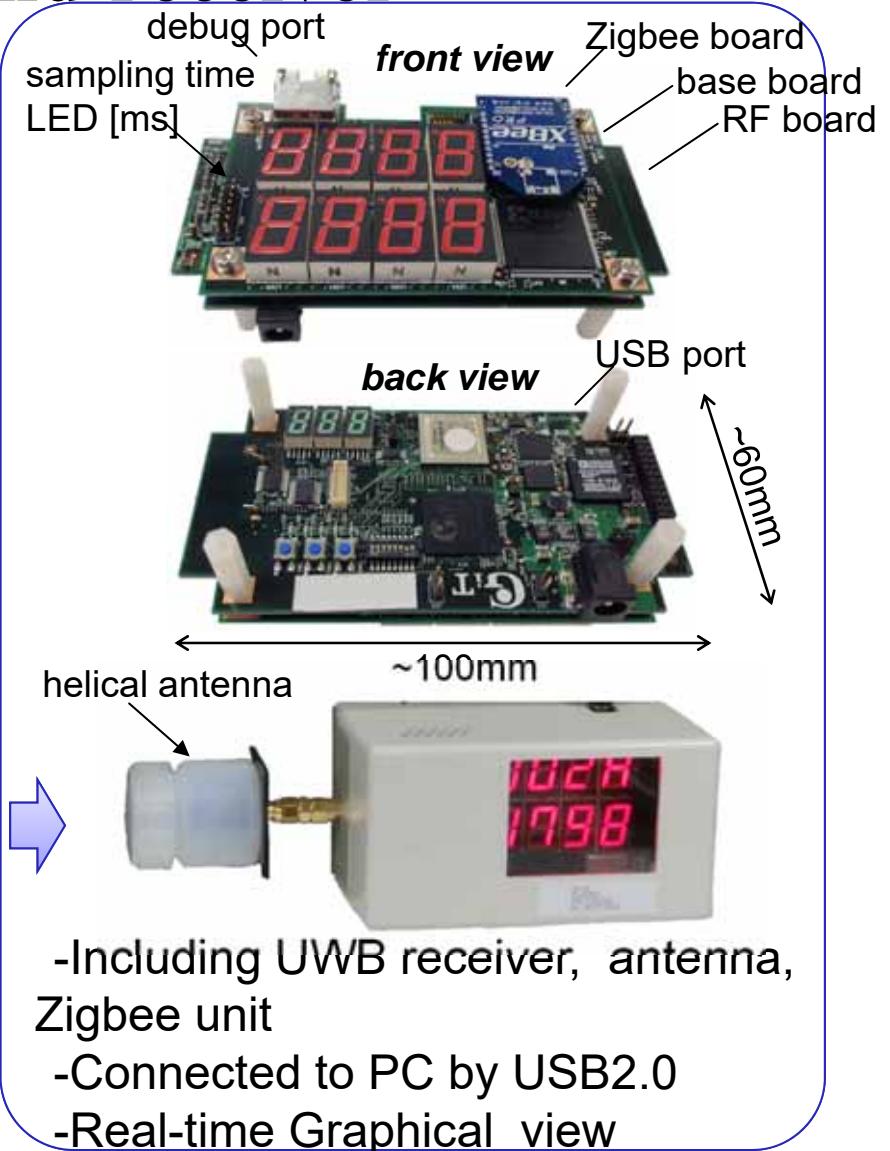

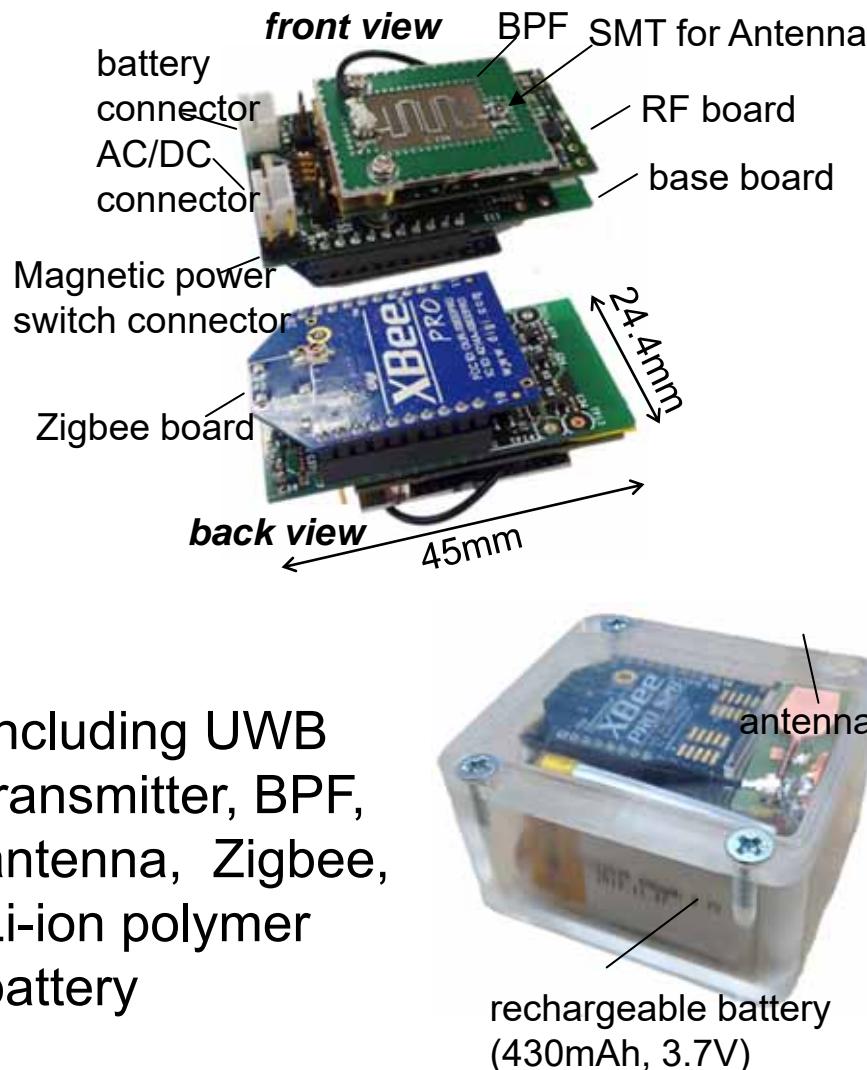

$$12\text{bit} \times 1\text{kHz} \times 4096\text{ch} \\ = 49\text{Mbps} \rightarrow \text{UWB}$$

(Ultra Wide Band)
+ Distributed system

UWB system (4096ch) -Prototype-

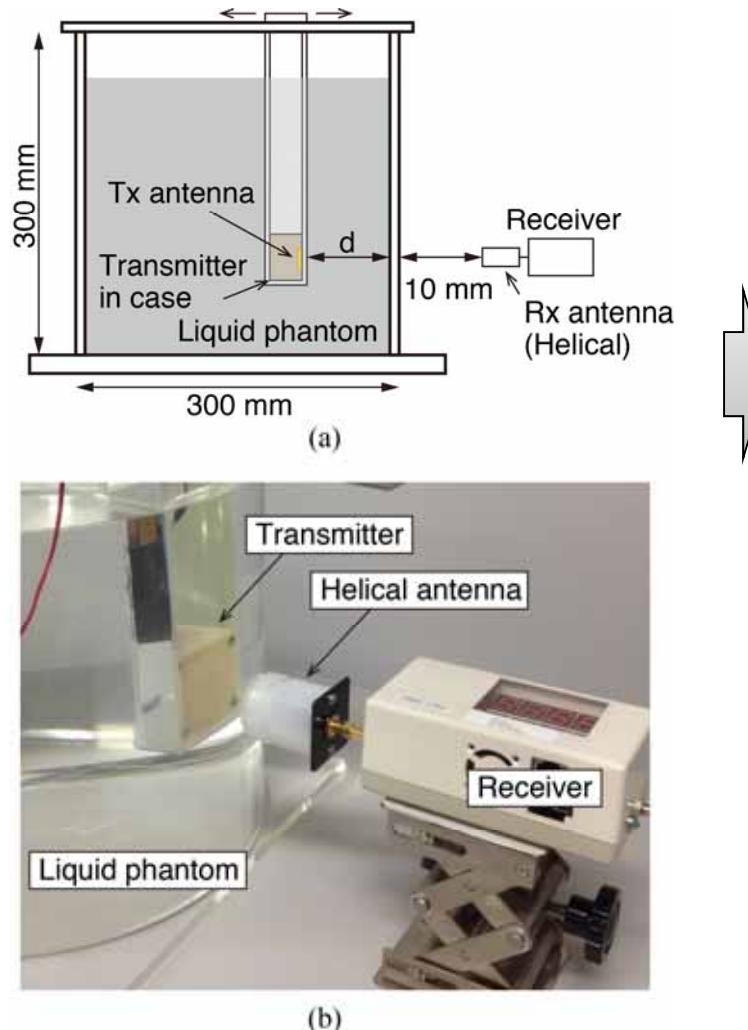

UWB transmitter and receiver

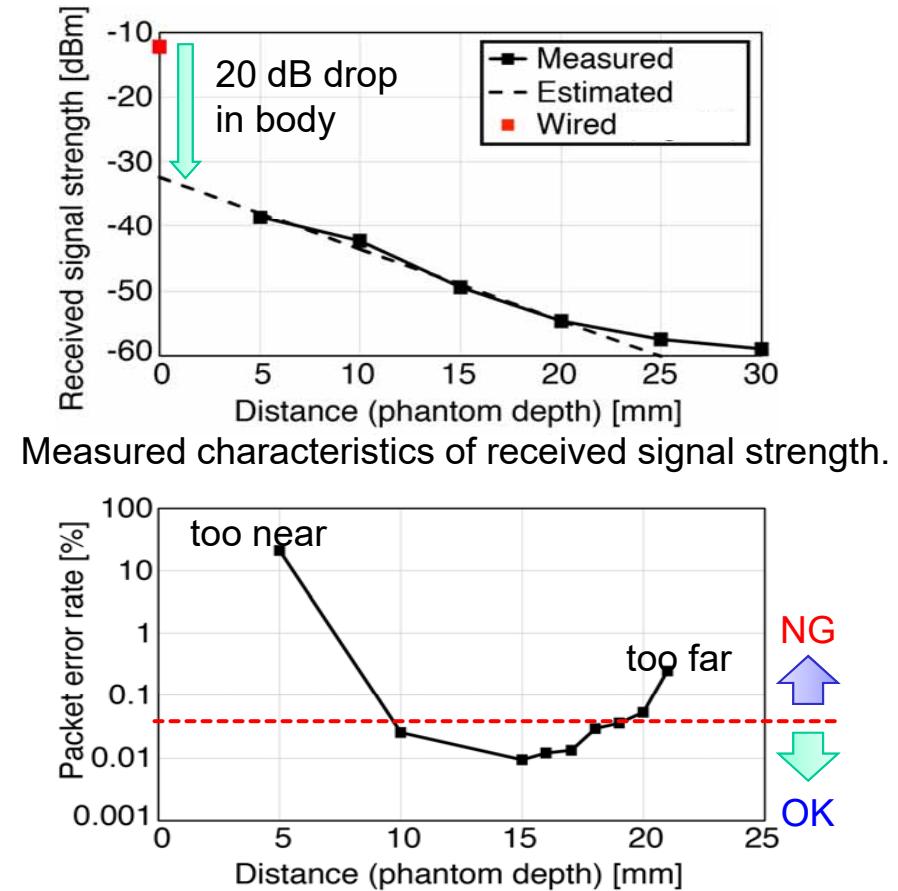

UWB system (Specification)

Number of channels	64~4096	ch	
Supply voltage	3.3	V	
Total power of implant devices	2.03	W	@4096ch (version 2014)
UWB bandwidth	7.275~8.525	GHz	for internationally usage
UWB data rate	128	Mbps	
MUX-A and MUX-B (common hardware)			
Xilinx Spartan6 XC6SLX16, FPC connector (11pin)			
UWB transmitter (water proof casing)			
RF, BPF and ZigBee board			
LVDS receiver (51.2Mbps), Magnetic Power SW (20mm range) and rechargeable Li polymer battery (400mAh)			
UWB receiver			
RF board, base board (Xilinx vertex4, USB2.0) and Zigbee board			
PC			
Core i7 3820 Win7 (USB2.0, GUI application)			

Evaluation of UWB in human equivalent liquid phantom

(a) Diagram and (b) photograph of the measurement setup.

Packet error rate with respect to the phantom depth.

128 Mbps UWB wireless communication is available below 20 mm between inside to outside body.
